Outline

Research summary

Background

Data from the IDI

Drivers of transience and vulnerable transience

Conclusion

- The study characterises the transient and vulnerable transient population in New Zealand.
- Transience is defined based on frequency of movement, direction of movement, and socio-economic status of neighbourhoods at both origin and destination of move.
- The research uses a wide range of data sets in the IDI to track individuals' residential movements and to evaluate the potential drivers of transience.
- The analysis finds that 4 percent of the population can be categorised as vulnerable transient (VT), and a further 1.3 percent can be categorised as transient (T).

Background

What is transience?

- Transient means temporary or short-lived. Superu defines transience as "Repeated disruption of key social support mechanisms (including residence) which is associated with negative impacts on social, health, education, and/or employment outcomes."
- 'Repeated disruption' has different implications for different population group of interest.
 - For children, frequent changes in school enrolments (Kariuki et al. 1999; Strand 2000; Bull & Gilbert 2007).
 - For families or households, moving residential address at least once a year (Morton et al. 2014).

What is transience?

- Transient means temporary or short-lived. Superu defines transience as "Repeated disruption of key social support mechanisms (including residence) which is associated with negative impacts on social, health, education, and/or employment outcomes."
- 'Repeated disruption' has different implications for different population group of interest.
 - For **children**, frequent changes in school enrolments (Kariuki et al. 1999; Strand 2000; Bull & Gilbert 2007).
 - For families or households, moving residential address at least once a year (Morton et al. 2014).

- Existing literature more often uses the term 'residential mobility' rather than 'transience'.
- Understanding the driving forces and consequences of transience requires differentiating between different types of moves.

- Existing literature more often uses the term 'residential mobility' rather than 'transience'.
- Understanding the driving forces and consequences of transience requires differentiating between different types of moves.
- Moves can be either voluntary and involuntary.

- Existing literature more often uses the term 'residential mobility' rather than 'transience'.
- Understanding the driving forces and consequences of transience requires differentiating between different types of moves.
- Moves can be either voluntary and involuntary.
- The drivers of moves broadly include relationship, economic, housing, health, justice, public policy and natural events.

- Existing literature more often uses the term 'residential mobility' rather than 'transience'.
- Understanding the driving forces and consequences of transience requires differentiating between different types of moves.
- Moves can be either voluntary and involuntary.
- The drivers of moves broadly include relationship, economic, housing, health, justice, public policy and natural events.
- The nature of residential relocation are also largely dependent on distance moved, neighbourhood qualities and type of housing people move into (Statistics NZ 2006; Exeter et al. 2015; Lupton 2016).

The need to identify the scale of transience

- Frequent residential moves, especially involuntary ones, can also worsen physical and mental wellbeing and future human capital (Heller 1982; Stokols et al. 1983; Magdol 2002; Schafft 2006).
- The implications of residential relocations include:

The need to identify the scale of transience

- Frequent residential moves, especially involuntary ones, can also worsen physical and mental wellbeing and future human capital (Heller 1982; Stokols et al. 1983; Magdol 2002; Schafft 2006).
- The implications of residential relocations include:
 - Adverse educational and health outcomes for children (Schwartz et al. 2015).
 - Poorer physical and mental well-being and labour market outcomes (Weinberg et al. 2004; Oishi 2010).

The need to identify the scale of transience

- Frequent residential moves, especially involuntary ones, can also worsen physical and mental wellbeing and future human capital (Heller 1982; Stokols et al. 1983; Magdol 2002; Schafft 2006).
- The implications of residential relocations include:
 - Adverse educational and health outcomes for children (Schwartz et al. 2015).
 - Poorer physical and mental well-being and labour market outcomes (Weinberg et al. 2004; Oishi 2010).
- The likely reasons for strong associations between residential movement and poorer outcomes can potentially be the drivers behind a move, rather than simply the move itself.

Data from the IDI

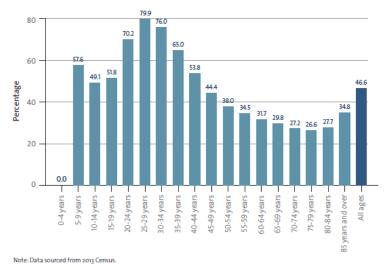

2013 Census evidence

- The Census is one of the commonly used data sources in the literature to capture information on residential movements.
- The study uses responses from two Census 2013 questions to identify movers and non-movers within five years and one year prior to the survey.

Residential move within 5 years	Duration of residence
Question: 'Where did you usually live 5 years ago, on 5 March 2008?' Response codes: 1 Same as usual residence 2 Elsewhere in NZ 3 Not born 5 years ago 4 Overseas 5 No fixed address 5 years ago 77 Response unidentifiable 99 Not stated	Question: 'How long have you lived at the address you gave in Question 5?' Response codes: Integer values o—98 representing the number of years a person lived in their current address 777 Response unidentifiable 999 Not stated

Notes: Sourced from the 2013 Census Data Dictionar

Population movement: 5 years prior to 2013 Census

Census versus the address notification table

- Census:
 - Lacks detail on the number of moves, duration of residence.
 - Dearth of information related to young children.
 - Potential recall bias?

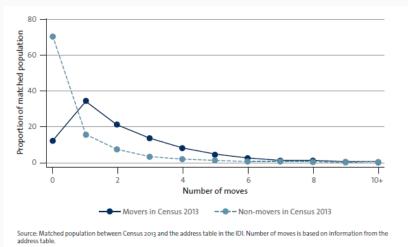

Census versus the address notification table

- Census:
 - Lacks detail on the number of moves, duration of residence.
 - Dearth of information related to young children.
 - Potential recall bias?
- The address notification table: As an alternative, the IDI combines information from a number of sources to produce an efficient geospatial resource for users.
- Address records are collected from eight sources (spanning six agencies):
 PHO registers (MOH);
 NHI records (MOH);
 MSD residential;
 MSD postal addresses;
 MOE records;
 ACC client addresses;
 IR tax registration addresses;
 and the 2013 Census.
- Addresses are geocoded by Stats NZ and prioritized.

 ACC client addresses;
 IR tax registration addresses;
 and the 2013 Census.
- Addresses are geocoded by Stats NZ and prioritized.
- Potential disadvantage is it is based on notification date.

Comparing census to the address notification table

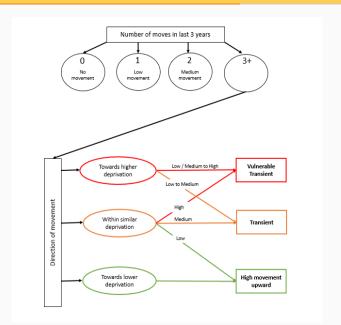

5 years prior to Census 2013 date

Populations of interest

- Reference period: 01 August 2013 to 31 July 2016
- The following exclusions are applied:
 - Death records during the reference period (DIA; MOH data).
 - Non-resident and non-citizens (MBIE immigration data).
 - Spent < 50% of time in NZ during reference period(Stats NZs international travel and migration data).
 - Born after the start of the reference period (DIA data).
 - Missing deprivation information.
- Final sample equates to 3,857,433 unique NZ residents who lived through the entire reference period for our analysis.

Defining residential movement groups

Size of key population groups

Population subgroups		Proportion of population sample
Nm	Non-movers	70.2%
Lm	Low movement	16.9%
Mm	Medium movement	7.3%
HmU	High movement (upward)	0.3%
Т	Transient	1.3%
VT	Vulnerable transient	4.0%
Popula	tion sample size	3,857,433

Drivers of transience and vulnerable

transience

Potential drivers of transience using the IDI

 We use multiple datasets in the IDI for information on people's prior life events, justice events, health events, social service usage, and social interventions targeted towards youth.

Potential drivers of transience using the IDI

- We use multiple datasets in the IDI for information on people's prior life events, justice events, health events, social service usage, and social interventions targeted towards youth.
- The above information is collected for a period prior to the reference period (denoted as the 'pre-reference period').
- **Pre-reference period**: 01 August 2008 to 31 July 2016.

Potential drivers of transience using the IDI

- We use multiple datasets in the IDI for information on people's prior life events, justice events, health events, social service usage, and social interventions targeted towards youth.
- The above information is collected for a period prior to the reference period (denoted as the 'pre-reference period').
- Pre-reference period: 01 August 2008 to 31 July 2016.
- The datasets used to construct binary indicators of independent variables are:
 - Personal details data (demographic information);
 - DIA life events (marriage and divorce);
 - MSD- WFF, Benefit dynamics, CYF, YST;
 - Housing NZ- Social housing receipt;
 - MOJ- Court charges and convictions;
 - MOH- PRIMHD, NNPAC, NMDS.

Logistic regressions

- Model 1: Adults

```
\begin{split} \log\left(\frac{P\left(VT\right)}{1-P\left(VT\right)}\right) &= \\ &\alpha_a + X\beta_a + \delta_{1a}. \, \text{Benefit} + \, \theta_{1a}. \, (\text{Benefit} \times \text{number weeks}) \\ &+ \delta_{2a}. \, \text{SocialHousing} + \, \theta_{2a}. \, (\text{SocialHousing} \times \text{number months}) \\ &+ \delta_{2a}. \, \text{CourtCharges} + \, \theta_{3a}. \, (\text{CourtCharges} \times \text{number convictions}) \\ &+ \delta_{4a}. \, \text{WFF} + \, \theta_{4a}. \, (\text{WFF} \times \text{number months}) \\ &+ \delta_{5a}. \, \text{Marriage} + \, \delta_{5a}. \, \text{Divorce} \\ &+ \delta_{7a}. \, \text{MentalHealth} + \, \theta_{5a}. \, (\text{MentalHealth} \times \text{number events}) \\ &+ \delta_{5a}. \, \text{EDvisit} + \, \theta_{6a}. \, (\text{EDvisit} \times \text{number days}) \\ &+ \delta_{9a}. \, \text{AcuteAdmission} + \, \theta_{7a}. \, (\text{AcuteAdmission} \times \text{number admissions}) \end{split}
```

- Model 2: Youth regression similar to adult, but removed marital indicators, and added CYF and YST indicators.
- Model 3: Child regression is similar to youth regression, but excludes YST and court charges.

Logistic regressions

- Model 1: Adults

```
\log\left(\frac{P\left(VT\right)}{1-P\left(VT\right)}\right) = \\ \alpha_{a} + X\beta_{a} + \delta_{1a}. Benefit + \theta_{1a}. (Benefit \times number weeks) \\ + \delta_{2a}. SocialHousing + \theta_{2a}. (SocialHousing \times number months) \\ + \delta_{5a}. CourtCharges + \theta_{3a}. (CourtCharges \times number convictions) \\ + \delta_{4a}. WFF + \theta_{4a}. (WFF \times number months) \\ + \delta_{5a}. Marriage + \delta_{6a}. Divorce \\ + \delta_{7a}. MentalHealth + \theta_{5a}. (MentalHealth \times number events) \\ + \delta_{9a}. EDvisit + \theta_{6a}. (EDvisit \times number days) \\ + \delta_{9a}. AcuteAdmission + \theta_{7a}. (AcuteAdmission \times number admissions)
```

- Model 2: Youth regression similar to adult, but removed marital indicators, and added CYF and YST indicators.
- Model 3: Child regression is similar to youth regression, but excludes YST and court charges.
- Note focus on both indicator and intensity variables.

- The odds of being VT are higher for Maori and women.
 - $\bullet~$ Maori are more than twice as likely to be VT than Europeans for adults.

- The odds of being VT are higher for $M\bar{a}$ ori and women.
 - $M\overline{a}$ ori are more than twice as likely to be VT than Europeans for adults.
- Association with benefits increases the likelihood of VT (odds ratio varies between 2.5 and 3).
 - Children associated with a benefit spell are 2.9 times more likely to be VT.

- The odds of being VT are higher for $M\bar{a}$ ori and women.
 - Māori are more than twice as likely to be VT than Europeans for adults.
- Association with benefits increases the likelihood of VT (odds ratio varies between 2.5 and 3).
 - Children associated with a benefit spell are 2.9 times more likely to be VT.
- Experiencing social housing in the pre-reference period is associated with risks of being VT.
 - The greater the number of months of social housing, the likelihood of being VT dropped

- The odds of being VT are higher for $M\overline{a}$ ori and women.
 - Māori are more than twice as likely to be VT than Europeans for adults.
- Association with benefits increases the likelihood of VT (odds ratio varies between 2.5 and 3).
 - Children associated with a benefit spell are 2.9 times more likely to be VT.
- Experiencing social housing in the pre-reference period is associated with risks of being VT.
 - The greater the number of months of social housing, the likelihood of being VT dropped
- The more court charges incurred in the pre-reference period, the greater the likelihood of being VT in the reference period.
 - The likelihood increases further with each additional charge that results in a conviction.

 $\hfill \blacksquare$ Having a divorce is associated with a 22.6% increase in likelihood of being VT.

- Having a divorce is associated with a 22.6% increase in likelihood of being VT.
- Having a health event in the pre-reference period is associated with a large increase in likelihood of being VT in the reference period.
 - For children, having a mental health event is associated with a 92.3% increased likelihood of being VT.
 - Similar patterns for emergency visits and acute admissions.

Conclusion

Scope for future research

Future research could delve into a number of avenues, including:

- Understanding the welfare impacts for individuals and their families after a period of being (vulnerable) transience, with a special focus on children and youth.
- Predictive risk analysis for services and programmes targeting vulnerable individuals and their families.
- Evaluate public policies that are targetted at the transient population.

Thank You

Thank you very much for your time.
